Methodology - Business Performance & Decision Lab (UCI Online Retail II)
Data: Dec 2009 - 9 Dec 2011. Gross sales = normal-sale lines only. Cancellations are credit notes (negative). Net revenue = gross + cancellations. Nothing is deleted, rows are labelled.
Headline: gross 19,700,954.46 | cancellations -719,692.94 | net 18,981,261.52 (same as the website and the SQL bridge).
Trend visuals use full months only (Dec 2011 stops on the 9th).
Customers: known customers only (5,852, about 87% of gross). Credit notes are not matched to customers.
Cohorts: month of first order, full months only; 28 customers who first ordered in the partial Dec 2011 are in no cohort. Dec 2009 is left-censored (includes customers already buying). Retention = active customers / cohort size.
RFM: scores 1-5 with CUME_DIST (one-order customers score F=2, so no one scores F=1). Snapshot 2011-12-10. Segments describe recency and frequency only, not future behaviour: Recent & frequent, Repeat buyers, Recent low frequency, Repeat not recent, Not recent low frequency, Mid recency low frequency.
Concentration: top p% = ceil(p x customers), ties broken by customer_id.
Products: joined by an integer product_key built from the exact stock code, so codes that differ only by upper/lower case stay separate and product totals match the website. Use product_label in visuals.
